

The TOTAL VIEW ONE Product Family

M-Series

M-Series is the cornerstone of the the product family. Whether you want to monitor global offices and data-centers, or start with the WAN links, M-Series is the foundation to your TOTAL VIEW ONE system. These robust servers collect, parse, and analyze the network data and deliver it back to you through the TOTAL VIEW ONE Secure Web Portal. These robust network appliances deliver a minimum gigabit/sec throughput, and are backed by PresiNET's performance guarantee.*

S-Series

S-Series Sensors allow you to scale the TOTAL VIEW ONE solution to your organization. With in and out of line monitoring capabilities (for the smaller office where switches may not support port replication), S100 and S500 sensors collect the connection summary data from remote networks, and send it (encrypted) to the M-Series appliance for processing. Delivering between 300 MB and Gigabit throughput, the S-Series line allows you to permanently deploy TOTAL VIEW ONE to a remote office, or rotate sensors around your organization as-needed.

Enterprise Solutions

If your Enterprise has more than 2000 IPs, PresiNET's qualified solutions team can build a custom TOTAL VIEW ONE Appliance to suit your organization. Our Network professionals will consult with your team, and design and test an appliance appropriately sized to serve your network, and can even install the system for you.**
